"The structure of the TATA-less rat tissue-type plasminogen activator gene. Species-specific sequence divergences in the promoter predict differences in regulation of gene expression.";

J. Biol. Chem. 265:2022-2027(1990).

-i- FUNCTION: TTA. CONVERTS PLASMINOGEN TO PLASMIN BY HYDROLYZING AND SINGLE R-V BOND IN PLASMINOGEN. ACTIVE IN TISSUE REMODELING AND DESTRUCTION, PARTICULARLY IN FIBRINOLYSIS, AND IN CELL MIGRATION.

-i- CATALYTIC ACTIVITY: SPECIFIC CLEAVAGE OF ARG-I-VAL BOND IN PLASMINOGEN TO FORM PLASMIN.

-i- MISCELLANEOUS: TPA ATTACHES TO THE KRINGLE STRUCTURE OF THE A

SUBUNIT: FOUND IN HIGH AND LOW MOLECULAR MASS FORMS. EACH CONS OF TWO CHAINS, A AND B. THE HIGH MOLECULAR MASS FORM CONTAINS LONG CHAIN A. CLEAVAGE OCCURS AFFER RESIDUE 155 IN THE LOW MOLECULAR MASS FORM TO YIELD A SHORT A1 CHAIN.

PHARMACEUTICAL: AVAILABLE UNDER THE NAME ABBOKINASE (ABBOTT).

IN PULMONARY EMBOLISM (PE) TO INTIATES FIBRINOLYSIS.

SIMILARITY: CONTAINS 1 KRINGLE REGION.

SIMILARITY: CONTAINS 1 EGF-LIKE DOMAIN.

SIMILARITY: BELONGS TO PEPTIDASE FAMILY S1; ALSO KNOWN AS THE

Searched: 188963 seqs, 23686106 residues

Post-processing: Minimum Match 0% Listing first 45 summaries

Database: a-geneseq35 1:geneseqp

Statistics: Mean 32.789; Variance 126.286; scale 0.260

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Claim 1; page 20-24; 50pp; English.

Claim 1; page 20-24; 50pp; English.

The present sequence represents human neurotrypsin. Neurotrypsin proteins and polynucleotides can be used: (i) to inhibit tumours, including metastases, e.g. of brain or retina; (ii) to minimise tissue damage caused by stroke or brain injury (having a protective effect on the penumbra zone); (iii) to treat or prevent neurodegeneration, neuroinflammatory disease (e.g. multiple sclerosis) or epilepsy; (iv) to increase survival of damaged neurons (e.g. in cases of hypoxia, cases of increase survival of damaged neurons (e.g. in cases of hypoxia, cases of cell death) in the neurous system; (vii) to regenerate brain causes of cell death) in the nervous system; (vii) to regenerate brain performance, including learning and memory; (x) to treat or prevent a cand/or lang-verse of psychiatric disorders; and (xi) to treat brain or lung verse of psychiatric disorders; and (xi) to treat brain or lung verse of psychiatric disorders; and (xi) to treat brain or lung verse of psychiatric disorders; and (xi) to treat brain or lung verse of psychiatric disorders; and (xi) to treat brain or lung verse of psychiatric disorders; and (xi) to treat brain or lung verse of psychiatric disorders; and (xi) to treat brain or lung verse of psychiatric disorders; and (xi) to treat brain or lung verse of psychiatric disorders; and (xi) to treat brain or lung verse of psychiatric disorders; and (xi) to treat brain or lung verse of psychiatric disorders; and (xi) to treat brain or lung verse of psychiatric disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Query Match

Claim 5; Page 27; 33pp; English.
This tPA variant has a deletion of amino acids Pro(466) to Leu(470) of the corresponding wild-type. It also has amino acids 432 and 434 substituted by Ala residues. The deletion is in the serine protease domain, making the variant more fibrin specific than the wild-type tPA. See R13917-R13922 and r14486.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                N-PSDB; X19027.

New serine protease expressed in brain tissue - used in screening for potential serine protease inhibitors for drug use Example 1; Page 51-54; 69pp; Japanese.

The present sequence is a serine protease designated BSSP-3, which is isolated from mouse brain tissue. Transformants may be used to produce the enzyme or its partial sequences. Products from the present invention are used for screening for potential peptide or non-peptide serine protease inhibitors or expression regulators for use as drugs.
                                                                                                                                                                                                                                                                                                New tissue plasminogen activator variant used for vascular conditions - e.g. to prevent fibrin deposition or adhesion formation or reformation, deep vein thrombosis, peripheral

Claim 5; Page 27; 33pp; English.

This tpA variant has a deletion of amino acids Pro(466) to Leu(470) of the corresponding wild-type. It also has amino acids 339 and 342 substituted by Ala residues. The deletion is in the serine protease domain, making the variant more fibrin specific than the wild-type tpA. See R13917-R13922 and R14486.
                                                                                                                                                                                                                                                                                     02-JUL-1998 (first entry)
Amino acid sequence of a novel human kallikrein.
Kallikrein; HKLP; human; serine protease; drug screening; agonist; treatment; hypertension; cardiac hypertrophy; art inflammatory disorder; blood clotting disorder.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      W46917 standard; Peptide; W46917;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  888888
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Query Match
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present sequence represents a novel human kallikrein (HKLP). Rallikreins are a large family of homologous serine proteases that act in a variety of circulatory and immune system functions. The cDNA sequence encoding HKLP was isolated from a heart tissue library, and was identified in cDNA, Incyte clone 307474, through a computer generated search for amino acid sequence alignments. HKLP shows 35% identity to rat kallikrein and 33% identity to human kallikrein. Unlike rat kallikrein, MKLP is hydrophobic in the carboxy terminus and likely to remain embrane bound. The HKLP protein has 3 potential glycosylation sites. The cDNA sequence encoding HKLP, and vectors and host cells containing it are useful for the recombinant production of HKLP. HKLP is useful in drug screening for potential antagonists (or agonists). The HKLP protein and cDNA are useful in the treatment of conditions such as hypertension, cardiac hypertrophy, arthritis, inflammatory disorders and blood clotting
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                29-JAN-1998.

Claim 12; Page 27; 33pp; English.
This tPA variant has a delation of amino acids Pro(466) to Leu of the corresponding wild-type. The deletion is in the serine protease domain, making the variant more fibrin specific than wild-type tPA. The variant also has a deletion of amino acids Cys(92) to Asp(179) of the wild-type sequence (i.e. Kringle 1 domain). See also R13917-R13921 and R14486.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New tissue plasminogen activator variant used conditions - e.g. to prevent fibrin deposition formation or reformation, deep vein thrombosis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              (GETH ) GENENTECH INC

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New tissue plasminogen activator variant used for vascular conditions - e.g. to prevent fibrin deposition or adhesion formation or reformation, deep vein thrombosis, peripheral vascular disease, embolism etc. Claim 5; Page 27; 33pp; English. This tPA variant has a deletion of amino acids Pro(466) to Leu(470) of the corresponding wild-type. It also has amino acids 416 to 418 substituted by Ala residues. The deletion is in the serine protease domain, making the variant more fibrin specific than the wild-type tPA. See R13917-R13922 and R14486.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    LT 10

Claim 11; Page 27; 33pp; English.

This tPA variant has a deletion of amino acids Pro(466) to Leu(470) of the corresponding wild-type. It also has amino acids 57 (Tyr) substituted by an Asn residue to create a glycosylation site. The deletion is in the serine protease domain, making the variant more fibrin specific than the wild-type tPA. See also R13917-R13922.
                                                                                                                                                                                                        sequence

Claim 5: Page 27: 33pp; English.
This tPA variant has a deletion of amino acids Pro(466) to Leu(470)
of the corresponding wild-type. It also has amino acids 426-7 and
429-430 substituted by Ala residues. The deletion is in the serine
protease domain, making the variant more fibrin specific than the
wild-type tPA. See R13917-R13922 and R14486.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New tissue plasminogen activator variant used for vascular conditions - e.g. to prevent fibrin deposition or adhesion formation or reformation, deep vein thrombosis, peripheral

New variants of human prourokinase (hPUK) comprise a hPUK deficient in (i) at least part of the first loop region of the epidermal growth factor (EGF) domain; (ii) at least part of the first loop and at least part of the second loop; or (iii) at least part of the third loop. The hPUK variants show an increased blood half-life comparable to that of the whole EGF domain-deficient hPUK variant and urokinase while retaining the same properties as those of hPUK. They have potent thrombolytic activity and very little tendency to cause spontaneous bleeding. The present sequence represents a specific variant of the whole hacks the entire EGF domain; the sequence does not

The hPUK variants show an increased blood half-life comparable to that of the whole EGF domain-deficient hPUK variant and urokinase while retaining the same properties as those of hPUK. They have potent thrombolytic activity and very little tendency to cause spontaneous bleeding. The present sequence represents a specific variant of hPUK which lacks loops 1 and 2 of the EGF domain; the sequence does not appear in the specification and has been created using the wild-type hPUK sequence and the junction sequence after deletion, both of which are given (in Fig 1 and on page 8,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   respectively).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Human pro-urokinase variants - deficient in loop regions of epidermal growth factor, showing long blood half-life, as
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             misc_difference

                                                                                                                                                                              he proenzyme consists of two identical chains linked by one or more disulfide bonds. It is activated by factor XIIa (or XII), which cleaves each chain into a light chain, which contains th active site, and a heavy chain, which associates with high molecular weight (HMW) kininogen.
catalyzes the proteolytic activation
